Benefits

Elevate your security with enterprise-grade endpoint protection specially built for businesses like yours.

Enterprise-grade protection

Protect your devices against ransomware and other cyberthreats with industry-leading Defender technologies like endpoint detection and response and threat and vulnerability management.

Easy to use

Get up and running quickly with easy, wizard-based onboarding. Out-of-the box policies and automated investigation and remediation procedures help automatically protect you against the latest threats, so you can focus on running your business.

Cost-effective

Security that just works, without onerous budgets. Available in two flexible options, as part of selected Microsoft 365 plans, or as a standalone solution.

What do You get?

Microsoft Defender offers automated enterprise-grade security to defend you from cyberthreats like ransomware in a cost-effective and easy to use solution

Threat and vulnerability management

Helps you to prioritise and focus on the weaknesses that pose the most urgent and highest risk to your business. By discovering, prioritising, and remediating software vulnerabilities, you can proactively build a secure foundation for your environment.

Attack surface reduction

Reduces your attack surface (areas that are potentially vulnerable to cyber-attack) across your devices and applications using capabilities such as ransomware mitigation, application control, web protection, network protection, network firewall, and attack surface reduction rules.

Next-generation protection

Helps to prevent and protect against threats at your front door with anti-malware and anti-virus protection—on your devices and in the cloud.

Endpoint detection and response (EDR)

Get behavioral-based detection and response alerts allowing you to identify persistent threats and remove them from your environment. Manual response actions within Defender for Endpoint will allow you to act on processes and files, while live response will put you in direct control of a device to help ensure it's remediated, secured, and ready to go.

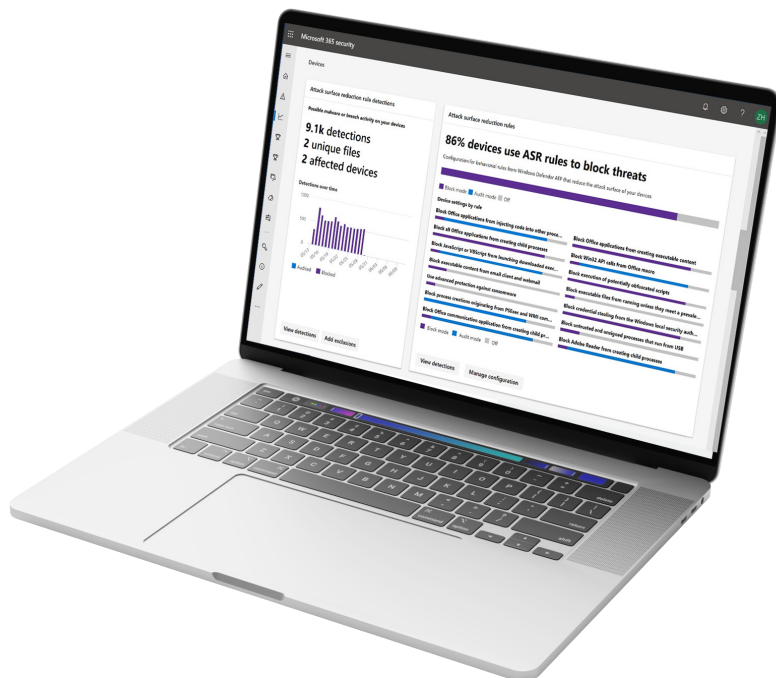

Automated investigation and remediation

Helps to scale your security operations by examining alerts and taking immediate action to resolve attacks. By reducing alert volume and remediating threats, Defender for Endpoint allows you to prioritise tasks and focus on more sophisticated threats.

The impact of cybercrime for many businesses can be hard to manage with potential financial, operational, and customer trust implications. Microsoft Defender for Endpoint is an all-in-one productivity and security offering, designed to help you run your business in the new hybrid work world, with peace of mind.
